Duplicated text – Delete text as shown below

5.1 Variables used for grouping

Data items used by the Version 8.0 grouper comprise diagnoses, interventions, age, sex, ~~mode of separation~~, length of stay (LOS), admission weight (AdmWt), sameday status and mode of separation, however, for Version 8.0 there is more reliance on diagnoses as the ADRG splitting variable. Specifications for these items have been taken from Australia's National Health Data Dictionary (AIHW 2014).
