

User Guide - ICD-10-AM to ICD-10 mapping tables

These tables provide one-to-one mappings to ICD-10 Second Edition for each Australian code each edition of ICD-10-AM (First, Second, Third, Fourth, Fifth, Sixth, Seventh and Eighth Editions). It can be assumed that all other ICD-10-AM codes not included in the tables are exactly the same as the codes in ICD-10.

The one-to-one mapping was achieved by recoding the ICD-10-AM concept in ICD-10. In the majority of cases this will result in the ICD-10-AM code being mapped to the code immediately above it in the hierarchy of both classifications (e.g. E10.11 maps to E10.1 in ICD-10). However, sometimes a concept will be coded to a different rubric in each classification. For example, Treacher Collins Syndrome is coded to Q87.04 in ICD-10-AM and Q75.4 in ICD-10 creating what looks like an error in the sequence when viewing the mapping table.

ICD-10-AM Code	ICD-10-AM Code Descriptor	ICD-10 Map
Q87.04	Treacher Collins [-Franceschetti] [-Klein] syndrome	Q75.4

The one-to-one map is sometimes difficult when a concept can map to more than one concept in ICD-10 and should be noted by those using the tables for research purposes. For example, iatrogenic pneumothorax was introduced as J93.2 in ICD-10-AM First Edition and is mapped to J93.8 *Other pneumothorax* but it could be argued that J95.8 *Other postprocedural respiratory disorders* is also appropriate. In these cases preference is given to a map within the hierarchy in which the ICD-10-AM code resides (J93.2 maps to J93.8).

Fields included

The fields included in these tables are:

- ICD-10-AM Code
- ICD-10-AM Code Descriptor
- ICD-10 Map

Values within the “ICD-10 Map” field

Some concepts in ICD-10-AM do not have equivalent concepts in ICD-10 and in those cases the map will be “nil”. For example, the ICD-10-AM code O09 *Duration of pregnancy* has no equivalent in ICD-10.

“Place=” relates to the ICD-10 subdivision for “place of occurrence” of the external cause of injury. The single character subdivision in ICD-10 has been expanded in ICD-10-AM to a full code and therefore maps to the single character subdivision in ICD-10.

“Act =” relates to the ICD-10 subdivision for “activity” of the external cause of injury. The single character subdivision in ICD-10 has been expanded in ICD-10-AM to a full code and therefore maps to the single character subdivision in ICD-10.
